

Regional implied heat transport from CERES data

Francesca Pearce and Alejandro Bodas-Salcedo

ERB and divergent transport

TOA Annual Radiation Budget

$$T_a(\theta) + T_o(\theta) = \int_{-\pi/2}^{\theta} 2\pi R^2 \cos\theta F_t d\theta$$

(after Vonder Haar and Suomi, 1971)

Local IHT from TOA radiation

- **CERES EBAF Ed4.1**
- **20-year annual climatology**

$$F_{\text{TOA}} = \nabla \cdot \mathbf{T} + \frac{d(\text{OHC})}{dt}$$

$$\mathbf{T} = \mathbf{T}_{\text{rot}} + \mathbf{T}_{\text{div}} = \nabla \times \mathbf{S} + \nabla P$$

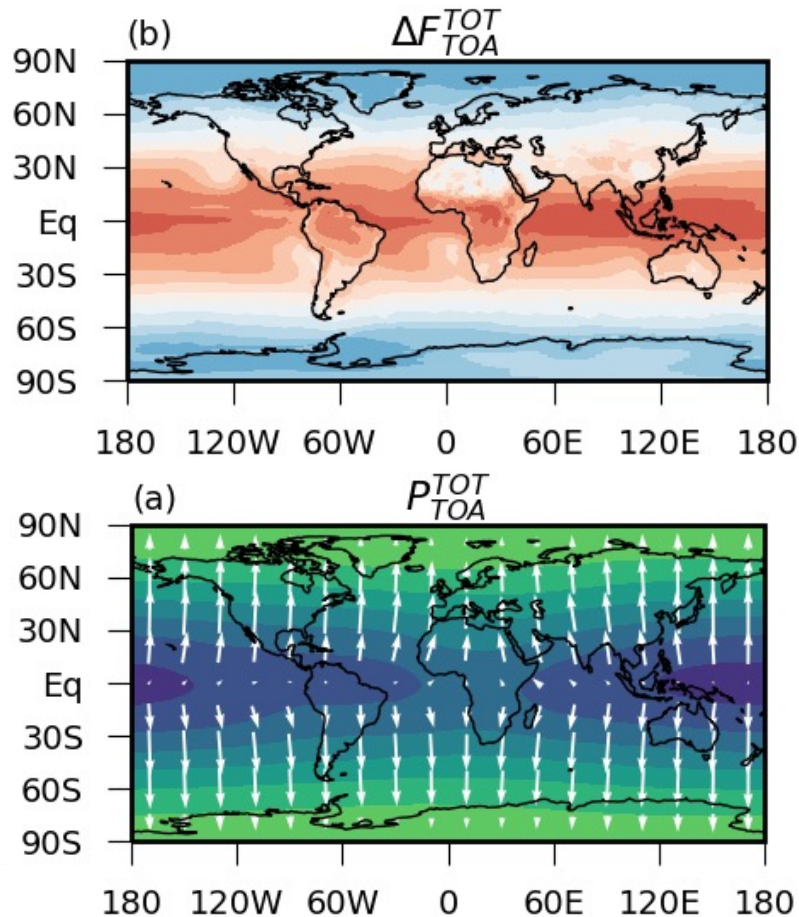

$$\nabla \cdot \mathbf{T} = \nabla \cdot \mathbf{T}_{\text{div}} = \nabla^2 P$$

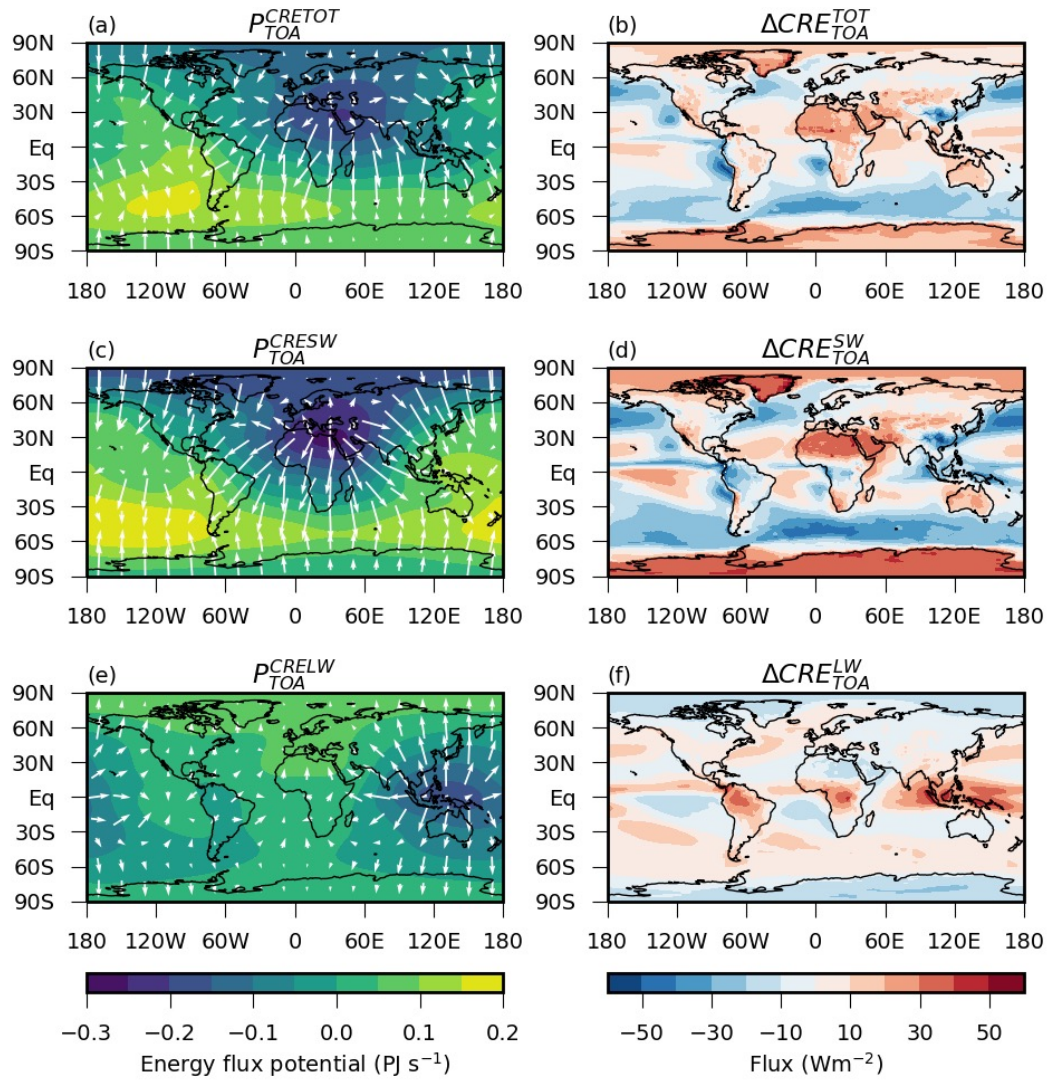

$$\nabla^2 P = F_{\text{TOA}} - \frac{d(\text{OHC})}{dt}$$

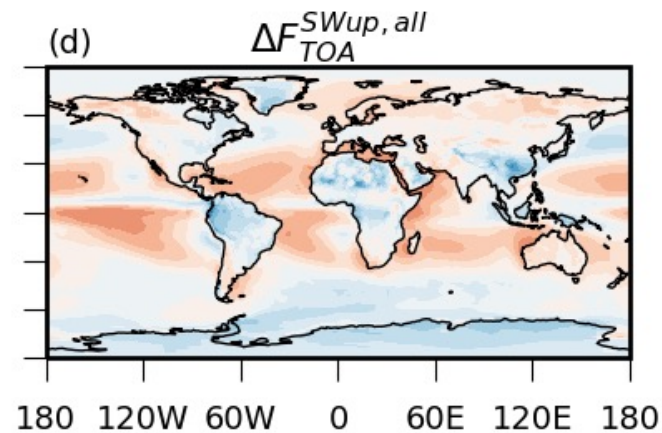

$$\nabla^2 P = F_{\text{TOA}} - \langle F_{\text{TOA}} \rangle$$

$$\mathbf{T}_{\text{div}} = \nabla P$$

(Boer, 1986;
Trenberth and Solomon, 1994;
Boos and Korty, 2016;
Forget and Ferreira, 2019)

Symmetry: albedo and IHT

(Vonder Haar and Suomi, 1971;
Voigt et al., 2013, 2014;
Stephens et al., 2016;
Haywood et al., 2016;
Bender et al., 2017;
Datseris and Stevens, 2021)

SW HT_{EQ} = 0.02 PW

(Loeb et al., 2016)

Conclusions

- Implied heat transport provides a complementary view to radiative fluxes that could be useful as diagnostic tool
- Direct effect of clouds: reduce horizontal transport with respect to clear-sky
- Hemispheric symmetry
 - SW: increase symmetry in tropics and decrease symmetry in extratropics
 - TOT: increase symmetry in poleward transport at all latitudes
- Framing symmetry in terms of transport provides a complementary view
- Future work
 - Split ATM/SFC using DEEP-C fluxes
 - Compare against models
